Endo-Perio (Upto 2 teeth)

Review report for CBCT: Cross-sectional & Panoramic images provided. Cross-sectional interval = 1.0mm.

Tooth #42 --

- Oblique horizontal impaction noted at the level of basal mandible - inferior cortex in right parasymphysis and anterior body regions.
- Incisal edge and third of crown seen in periapical area of tooth #44 with indentation - thinning of adjoining mandibular buccal cortical plate.
- Well-defined corticated pericoronal radiolucency measuring app.10.7mm x 8.0mm x 14.3mm in antero-posterior, transverse and supero-inferior dimensions, attached to proximal CEJ region(s) of impacted tooth noted. Finding suspicious for pericoronal or follicular cyst.
- A tiny ovoid tooth / dentinal density also seen with the pericoronal rarefying lesion, in mesial apical peri-radicular area of tooth #43.
- Oblique horizontal orientation of the solitary root in basal mandible; with apical bifurcation into tiny labial - lingual rootlets that indent underlying inferior mandibular cortex in 42-41 area.

Dr. Sharad Sahai, MDS (Goa)

Consultant Oral & Maxillofacial Radiologist
